

As an Enterprise Architect, you are helping our customers to make sure that their business strategy uses proper technology systems architecture to achieve its goals. You help them to keep up with the latest trends in technology and determine whether these would be the right fit to support their business. Our focus is on enterprise customers that are starting or executing on their digital transformation. Enterprise architects cover all technical aspects and, to a degree, the business aspects as well. They must fully understand a company's business, keep track of technology concerns as well as those of the business, and strive to make alignment between technology and the business more transparent.

At 45 Degrees we did specifically add "technology" to the job title. While the baseline definition of an Enterprise Architect clearly includes the technology aspect, we see in the day to day reality that more and more enterprise architects are drifting away from the technology and position themselves as "technology agnostic". We believe that customers on a transformation journey need enterprise architects that do have a strong technology background. You rely on your experience with Cloud technologies and other contemporary digital corporate applications. The fields in which you implement your knowledge can be numerous:

- AI, big data of IoT
- Enterprise infrastructure
- Migration of cloud applications
- Native Cloud application projects
- Cloud DevOps and Governance model design

With your broad expertise, you combine the strengths of different technologies into relevant, creative, performant, scalable and reusable solutions. You are the single point of contact for your clients and translate their needs into technical scripts like no other.

Innovation makes your heartbeat faster. You follow new industrial and technological trends and have the capacity to manage the complexity of your projects with a pragmatic approach. You design and present concepts, architectures and solutions to C-levels, as to more technical profiles.

You have a clear technological overview of Cloud technology. By preference the three Microsoft Clouds (Azure, O365, Dynamics 365). You will cooperate with technology-specific (cloud) architects who deliver their profound technical knowledge. On top of that, you host ideation sessions and take different stakeholders on a journey of innovation.

Your profile

Experience is key. As a professional, we expect 10 years of professional experience in IT and architecture. During these years, you have gained an overview of all different (Microsoft) Cloud technologies and you're able to fit different components into one working solution. Ideally you have an Azure Fundamentals or an AWS Cloud Practitioner certification. If not, you have the ambition to get one in the near future.

Additionally, the role of Enterprise Technology Architect requires strong skills in building relationships, analysis, architecture, problem solving, decision making and program management. You are a motivated self-starter who communicates effortlessly and can build solid partnerships on all levels within our organisation, our clients and partners.

What do we offer?
